

All-vanadium liquid flow battery rate

Overview

In this paper, the flow rate optimization is investigated for the first time for vanadium flow batteries using a dynamic model which considers the variation of cell resistance and electrolyte viscosity versus temperature. To start with, a dynamic VFB model is developed. The vanadium redox battery (VRB), also known as the vanadium flow battery (VFB) or vanadium redox flow battery (VRFB), is a type of rechargeable flow battery which employs vanadium ions as charge carriers. [5] The battery uses vanadium's ability to exist in a solution in four different oxidation. The vanadium flow batteries that employ the vanadium element as active couples for both half-cells, thus avoiding cross-contamination, are promising large-scale energy storage devices. However, the development of VRFBs is hindered by its limitation to dissolve diverse.
