These innovative systems integrate agricultural activities with solar energy production, enabling the dual-use of land and minimizing competition between agriculture and energy generation.

As solar-generated electricity is increasing, some landowners are pondering converting land used to produce food to land used to produce energy, but what if they could do both?

The process of combining agricultural production and solar panels on the same farmland, known as agrivoltaics, has seen a great leap in Cornell research activity.

An interdisciplinary team of MSU researchers will study how soil, water and ecosystems are impacted by solar panels, revealing how they could improve soil health, conserve groundwater ...

It will analyze various solar technologies deployed across different agricultural applications and assess their feasibility and viability based on performance, costs, socio-economic and environmental factors ...

A Purdue University research team has demonstrated how to optimize yield in corn fields equipped with solar power arrays that throughout the day cast dynamic shadows across growing crops.

State policymakers seeking to balance needs for both energy and food production and reduce land use competition have been exploring the development of dual-use solar and agriculture systems, ...

Hosted by American Farmland Trust Learn how to build a business incorporating agriculture and solar energy generation on the same piece of land.

The Agriculture and Forestry Building atrium is made with energy efficient glass panes that limit heat exchange and are embedded with translucent photovoltaic panels which generate power for the ...
