Efficient and cheap batteries that can also capture harmful emissions could be right around the corner, thanks to a new system that speeds up the development of catalysts for lithium ...

Based on a systematic investigation on aprotic Li-CO₂ electrochemistry, we design a flexible strategy for either CO₂ fixation or energy storage. Typically, CO₂ can be fixed into carbon ...

The high temperature liquid metal-CO₂ batteries may find important applications in EES for combustion-based power plants and renewable energy systems with permanent carbon fixation via simultaneous CO₂RC.

Lithium-CO₂ batteries are attractive energy-storage systems for fulfilling the demand of future large-scale applications such as electric vehicles due to their high specific energy density. ...

Therefore, utilizing a reversible battery system for renewable energy storage in a cost-effective and eco-friendly CO₂ fixation strategy would be an ideal model. Here, we first provide a new strategy for CO ...

Li-CO₂ batteries that integrate energy storage with CO₂ fixation are expected to be a promising technology in the pursuit of carbon neutrality. However, cathode passivation and structural damage ca...

Li-CO₂ batteries with a theoretical energy density of 1,876 Wh kg⁻¹ are attractive as a promising energy storage strategy and as an effective way to reduce greenhouse gas emissions by CO₂ reduction and the ...

The Li-CO₂ battery represented an enticing energy storage/output system characterized by its high-specific energy capacity and simultaneously achieving CO₂ fixation and conversion, which held ...

In contrast to conventional soluble RMs, we put forward a strategy of using solid redox mediators (solid RMs) fixed and anchored on the cathode of Li-CO₂ batteries. This approach...

Pumped Thermal Energy Storages are based on charge and discharge phase (heat pump cycle + power cycle), storing thermal energy, both hot and cold.
