What is a PV combiner box?

of such an installation is the PV combiner box. These boxes are used to combine several strings and to protect against overvoltage and feature many more functions. How do I find out if fuses are required? Depending on the kind of photovoltaic installation, a combiner box with fuses is required. According to the IEC 625

Do I need a combiner box with fuses?

Installation, a combiner box with fuses is required. According to the IEC 625 the following formula must be applied: If $I_x \times 1.25 \times (\text{number of strings} - 1) = I_{sc}$; then fuse return current = return current of the module of 15A. The first calculation in the graphic below shows first an installation with only one string. Applying the formula from IEC

Do I need a fuse for a PV module?

IEC 60384-21:2016, it shows that no fuse is required. The same applies for the calculation with two strings. In both cases, it does not make sense to install a fuse because the fuse will never blow and the currents are too low to damage the PV module. For the last calculation, a setup with three strings is taken into consideration. Here the

Are currents too low to damage a PV module?

currents are too low to damage the PV module. For the last calculation, a setup with three strings is taken into consideration. Here the condition that fuses are required is higher than 15A. All installations with
