Abstract This study presents the development of a solar-driven thermally regenerative electrochemical cell (STREC) for continuous power generation.

Solar-driven electrochemical water splitting cells, known as photoelectrochemical (PEC) cells, with integrated photoelectrode (s) that directly convert solar to chemical energy via generation ...

Solar energy can be used to convert basic chemical feedstocks such as carbon dioxide (CO₂) and water into fuels that offer grid stability, energy security, and environmental benefits. NLR ...

One promising pathway is the production of green hydrogen via electrolysis, particularly when coupled with renewable energy sources like solar power. Integrating a proton exchange ...

Researchers combine solar energy, electrochemistry, and thermal catalysis to remove the need for fossil fuel-driven chemical conversions.

Our findings indicate that this combination holds significant promise for efficient and continuous solar power generation.

To address these challenges, this study investigates the fundamental principles of solar hydrogen production and examines key energy losses in photovoltaic-electrolyzer systems.

Four methods of H₂ production are under development including photoelectrochemical (PEC), proton exchange membrane electrolysis cell (PEMEC), solid oxide electrolysis cell (SOEC), and solar ...

Based on this comparative analysis, we offer an outlook on solar-driven electrochemical hydrogen production coupled with chemical synthesis.

The scope includes a thorough analysis of the three main solar-powered hydrogen generation processes: (i) PEC water splitting, (ii) concentrated solar-powered thermochemical water ...
