China is currently planning to build a gigantic solar power station ...

China is pushing the boundaries of renewable energy with its ambitious plan to build kilometer-wide space solar stations that will beam energy directly to Earth.

Space-based solar power (SBSP or SSP) is the concept of collecting solar power in outer space with solar power satellites (SPS) and distributing it to Earth.

Above the clouds and outside the day-night cycle, solar panels in orbit would receive nearly constant sunlight. They could, in principle, convert that light into electricity, beam it down as...

Space-based solar power works much like solar on Earth - panels convert sunlight into electricity - but with one huge advantage: they're above the atmosphere. This means those panels ...

Chinese scientists have announced a plan to build an enormous, 0.6 mile (1 kilometer) wide solar power station in space that will beam continuous energy back to Earth via microwaves.

China is currently planning to build a gigantic solar power station in space. To get parts of the array out of our atmosphere, scientists are working on a reusable heavy lift rocket called...

Once considered a book-only sci-fi fantasy, space-based solar power, or SBSP, is now gaining popularity as a potential sustainable energy source for the future.

China gears up to develop solar power stations in space that can transfer the sun's energy in the orbit back to the ground on Earth. It draws from the idea of space-based solar power.

Utilizing SBSP entails in-space collection of solar energy, transmission of that energy to one or more stations on Earth, conversion to electricity, and delivery to the grid or to batteries for storage.

Solar power stations built in space

Space-Based Solar Power (SBSP or SSP), the concept of gathering solar power in space using solar power satellites (SPS) to send it back to Earth, may sound like science fiction, but it is ...
