The Solar System, named after the Sun, originated approximately 4.6 billion years ago from the collapse of a molecular cloud, resulting in the formation of the Sun ...

The solar system came into being about 4.5 billion years ago when a cloud of interstellar gas and dust collapsed, resulting in a solar nebula, a swirling ...

The favored paradigm for the origin of the solar system begins with the gravitational collapse of part of an interstellar cloud of gas and dust having an initial mass only 10-20 percent ...

Solar system - Formation, Planets, Orbits: The current approach to the origin of the solar system treats it as part of the general process of star ...

In 2007, researchers at the University of California-Davis determined that our Solar System was fully formed at 4.568 billion years ago. They did this by determining the age of stony materials from the ...

The central condensation eventually formed the Sun, while small condensations in the disk formed the planets and their satellites. The energy from the young Sun blew away the remaining gas and dust, ...

The solar system began to form about 4.6 billion years ago - 9.2 billion years after the Big Bang. Scientists think that its formation was triggered by the shockwave from a nearby supernova - an...

Most of the collapsing mass collected in the center, forming the Sun, while the rest flattened into a protoplanetary disk out of which the planets, moons, asteroids, and other small Solar System bodies ...

Our solar system formed much later, about 4.6 billion years ago. It began as a gigantic cloud of dust and gas created by leftover supernova debris--the death of other stars created our own.

The formation and evolution of the Solar System describes how the Solar System began, and how it changed.

Solar system establishment

About 4.6 billion years ago, there was a large cloud of gas nearby our area of space.

This chapter describes our current understanding of the key processes that shaped our planetary system, informed by empirical data such as meteorite measurements, observations of ...

Thus, while direct observation of the prior states of our Solar System is not possible from the vantage point of Earth, the signatures of planetary and lunar orbits, as well as the history of life and ...

The system formed about 4.6 billion years ago when a dense region of a molecular cloud collapsed, creating the Sun and a protoplanetary disc from which the orbiting bodies assembled.

Our solar system formed about 4.6 billion years ago from a dense cloud of interstellar gas and dust. The cloud collapsed, possibly due to the shockwave of a nearby exploding star, called a ...

Explore the fascinating history of the solar system. Journey through billions of years, from the Big Bang to today, and unlock cosmic secrets.

For many years theories of the origin of the Solar System were based on rather little hard evidence. Motions of the planets were well observed and orbital radii were seen to follow a regular, if ...
