Can small base stations conserve grid energy in hybrid-energy heterogeneous cellular networks?

Abstract: Dense deployment of small base stations (SBSs) within the coverage of macro base station (MBS) has been spotlighted as a promising solution to conserve grid energy in hybrid-energy heterogeneous cellular networks (HCNs), which caters to the rapidly increasing demand of mobile user (MUs).

Does a hybrid network consume more energy than a full-digital network?

The energy consumption of the network gets increases as the density of small cells rises. Certain findings as indicated above suggests that hybrid architectures in massive MIMO systems have much higher achievable EE, although their SE is lower than full-digital architectures.

How BS affect the energy consumption of a cellular network?

To contribute to the expansion of mobile traffic, a large number of BS are required. In a regular cellular network, the BSs consume more than half of the total energy, therefore their increased numbers have a significant influence on the overall energy consumption.

Can a wireless network bridge the gap between high data rates?

It offers a potential solution for bridging the gap between high data rates and long idle times in the 5G mobile network. Wireless signals may carry both information and energy at the same time, implying that transmitters may not only communicate data but also supply energy to power the batteries of other equipment.

The rapid evolution of wireless communications toward 6G networks has intensified concerns about sustainability, as ultra-dense deployments of small-cell base stations demand unprecedented levels ...

A small-scale communication base station communication antenna with an average power of 2 kW can consume up to 48 kWh per day. 4,5,6 Therefore, the low-carbon upgrade of communication base stations ...

Powering telecom base stations has long been a critical challenge, especially in remote areas or regions with unreliable grid connections. Telecom operators need continuous, reliable energy to keep ...

Why does the hybrid energy of communication base stations become smaller

Energy efficiency constitutes a pivotal performance indicator for 5G New Radio (NR) networks and beyond, and achieving optimal efficiency necessitates the meticulous consideration of trade-offs against ...

In this paper, hybrid energy utilization was studied for the base station in a 5G network. To minimize AC power usage from the hybrid energy system and minimize solar energy waste, a Markov ...

The communication base station hybrid system emerges as a game-changer, blending grid power with renewable sources and intelligent energy routing. But does this technological fusion truly solve the 37% ...

Dense deployment of small base stations (SBSs) within the coverage of macro base station (MBS) has been spotlighted as a promising solution to conserve grid energy in hybrid-energy heterogeneous ...

In 3G and LTE cellular networks, Radio Access Network (RAN) consumes the major part of energy with the base station (BS) using 75-80 % of the network's energy [4]. Hence, reducing the power at ...

In today's 5G era, the energy efficiency (EE) of cellular base stations is crucial for sustainable communication. Recognizing this, Mobile Network Operators are actively prioritizing EE for both network maintenance and ...

In the context of 5th-generation (5G) mobile communication technology, deploying indoor small-cell base stations (SBS) to serve visitors has become co...
